PUBLIC HEALTH ADVISORY

To: All HAN Recipients
From: Isaac Benowitz, State Epidemiologist, Maine CDC
Allison Kanoti, State Entomologist, Department of Agriculture, Conservation and Forestry's Maine Forest Service (MFS)
Subject: **Health Risks from Browntail Moths**
Date / Time: Tuesday, May 13, 2025, at 10:00AM
Priority: Normal
Pages: 3
Message ID: 2025PHADV010

Health Risks from Browntail Moths

Background

The browntail moth is an invasive species of both forest and human health concern. Maine is the only state in the U.S. currently experiencing widespread problems with this moth. The microscopic hairs found on browntail moth caterpillars, shed skins, and cocoons can cause skin reactions and breathing problems. Providers should be aware of the risk of browntail moth hairs, and the public should know what they can do to help reduce exposure to browntail moth caterpillar hairs. Browntail moth caterpillars are hairy, dark brown caterpillars with two red-orange dots on the back. Older caterpillars have two broken white stripes running from head to tail.

Symptoms

Most individuals affected by the hairs develop a localized rash similar to poison ivy that will last for a few hours up to several days. In more sensitive individuals, the rash can be severe and last for weeks. Dislodged hairs can become airborne and cause trouble breathing if inhaled, including respiratory distress. Symptoms result from both a chemical reaction to a toxin in the hairs and a physical irritation as the barbed hairs become embedded in the skin and airways.

Seasonality

Caterpillars are active from April to early July. Hairs from caterpillars, shed skins, and cocoons can become airborne and settle on vegetation and other surfaces. They can be stirred up during mowing, raking, sweeping, and other outdoor activities. Hairs remain toxic for 1-3 years in the environment but lose their toxicity over time.

Maine summary

DACF's Maine Forest Service surveys indicate that most areas of Maine that have significant host tree populations are at some risk for browntail moth infestation. Preferred host trees include apple, birch, cherry, crabapple, oak, and pear, as well as other hardwoods. Every county in Maine has had at least some browntail moth webs or caterpillars detected in them since 2022. Aerial surveys in 2024 documented reduced defoliation acreage compared to previous years, suggesting browntail moth populations may be collapsing. However, 2025 winter web surveys revealed notably higher populations in portions of Androscoggin, Cumberland, Franklin, Hancock, and Oxford Counties. Those winter web surveys revealed webs in all but Aroostook County this year.

Even in areas with browntail moth management the risk to the public remains high due to the persistent nature of the hairs. People may also experience impacts even in areas with low or undetected populations of browntail moths. Visit the [Interactive Browntail Moth Dashboard](#) to see where the MFS has noted significant browntail moth activity in recent years. Visit the Maine Department of Agriculture, Conservation, and Forestry's [Knock Out Browntail web pages](#) for information on the recognition, management and mitigation of browntail moth impacts.

Information for providers

- Be aware of the risk of browntail moth hairs, particularly in areas with known populations.
- There is no specific treatment for dermatitis due to browntail moths; treatment is focused on relieving symptoms and eliminating ongoing exposure.
- Mild rashes may be treated with calamine or Caladryl lotion, hydrocortisone cream, or taking a cool oatmeal or baking soda bath. Severe reactions may require prescription medication.
- The toxin in the hairs is extremely stable and can remain a hazard in the environment for years.

Recommendations to reduce exposure

- Avoid places heavily infested by caterpillars.
- Take cool showers and change clothes after any activity that may expose you to browntail moth hairs.
- In areas with current or recent browntail moth populations:
 - Dry laundry inside during June and July to avoid having the hairs embedded in clothing.
 - Cover your face and any exposed skin by wearing a long sleeve shirt, long pants, a dust mask, a hat, and a disposable coverall when performing activities that stir up caterpillar hairs such as mowing, raking, weed whacking, and removing pupal webbing.
 - Perform these tasks on damp days or spray down vegetation with a hose. The moisture helps keep the hairs from becoming airborne while working.

For more information

- Contact 211 Maine for answers to frequently asked questions on browntail moths:
 - Dial 211 (or 207-874-2211)
 - Text your zip code to 898-211
